University of Saskatchewan  
**EE 325 Communication Systems I**  
**Quiz #1 - Jan. 29/2001**

Time: 30 minutes - all questions have equal value

Permitted:- text, printed notes, student's own hand-written materials

Use the space below each question for your answer.

1 1/2  
 2 L  
 3 0  
 4 1  
 5 1  
 6 1/2  
 (4/12)

\*2.0 A radio frequency transmitter has a preamplifier with voltage gain 15 followed by a power amplifier with gain 16 dB. If the input and load impedances are 50Ω and the preamplifier input voltage is 20 mVrms. What is the output power (in Watts)?

pre Gain = 15  
 20 mVrms  
 $P_{in} = \frac{(V_{rms})^2}{R}$   
 $P_{in} = \frac{(0.02V)^2}{50\Omega}$   
 $P_{in} = 0.0008 \text{ mW}$

power Gain 16 dB  
 $= 10 \log_{10} \left( \frac{P_o}{P_i} \right)$   
 $16 = 10 \log_{10} \left( \frac{P_o}{0.0008} \right)$   
 $1.6 = \log_{10} \left( \frac{P_o}{0.0008} \right)$   
 $10^{1.6} = \frac{P_o}{0.0008}$   
 $40 = \frac{P_o}{0.0008}$   
 $P_o = 0.128 \text{ mW}$

$P_{in} \cdot \text{Gain} = P_{out}$   
 $0.0008 \text{ mW} \cdot 16 = P_{out}$   
 $P_{out} = 0.0128 \text{ mW}$

$0.128 \text{ mW} - 40 = P_{out}$   
 $4.78 \text{ mW} = P_{out}$

\*2.2 An oscilloscope measures a 500 Hz sinusoid with peak-to-peak voltage of 3.8 volts. Determine the a) normalized power, b) level in dBV and c) level in dBm (600Ω)

a)  $P_n = \frac{(V_{rms})^2}{R}$   
 $V_{rms} = \frac{3.8V}{2\sqrt{2}} = 1.32V$   
 $P_n = \frac{(1.32V)^2}{600\Omega} = 2.92 \text{ mW}$

b)  $20 \log_{10} \left( \frac{V_o}{1V_{rms}} \right) = \text{dBV}$   
 $20 \log_{10} \left( \frac{1.32}{1} \right) = 2.3 \text{ dBV}$

c)  $P_n = \frac{V_{rms}^2}{R}$   
 $= \frac{(1.32V)^2}{600\Omega} = 0.00292 \text{ W}$   
 $P(\text{dBm}) = 10 \log_{10} \left( \frac{0.00292 \text{ W}}{1 \text{ mW}} \right) = 10.8 \text{ dBm}$

\*2.20 Example 2-14 shows Fourier series components for a 2 kHz square-wave with amplitude ± 2V. Recalculate the 10 kHz component to an accuracy of 5 decimal places. (hint: the complete spectrum can be obtained by first adding a 2 volt dc offset then analyzing the resulting 0-4 volt pulse sequence and then removing the zero Hz component (2 volts) from the calculated spectrum).

\*3.1 Drill Problem - Amplitude Modulation - For a carrier signal  $c(t) = 100V \cos 2\pi 20000t$  and the following modulation signals, determine the sinusoidal component amplitudes (in volts) and component frequencies (in kHz).

Modulation Signal	A1	F1	A2	F2	A3	F3	A4	F4
$2V \cos 2\pi 4000t$	100	16	100	24				
$4V \cos 2\pi 11000t$	200	9	900	31				
$2V + 4V \cos 2\pi 3000t$	200	3	200	20	200	43		
$\cos 2\pi 4000t + \cos 2\pi 8000t$	50	12	50	16				
Checksum	550	40	550	91	250	67	50	28

$\frac{11 \cdot 2 \times 100}{2}$   
 $\frac{4 \times 100}{2}$   
 $\frac{4 \times 100}{2}$   
 $\frac{100}{2}$

\*3.4 A baseband color television signal has frequency components ranging from 0.1 Hz to 4.6 MHz. a) What is the theoretical minimum sampling rate that can faithfully reproduce this signal? b) Suggest a practical minimum sampling rate. c) What is the bit rate in the practical case if 8 bit PCM coding is used?

0.1 Hz 4.6 MHz  
 a)  $f_{min} = 2(4.6 \text{ MHz}) = 9.2 \text{ MHz}$   
 b) 20% higher = 11.04 MHz  
 c) ?

\*5.11c A 10 kHz sinusoid is quantized using a 16-bit LPCM encoder/decoder with 44 kHz sampling rate. Assume that sinusoid uses only one-eighth of the encoder voltage range and that the output reconstruction filter has sin x/x correction with 0-22 kHz ? Determine the SNR of the reconstructed sinusoid.

$SNR = N(6.02) + 1.77$   
 $= 16(6.02) + 1.77 = 99.09$   
 $SNR = 10 \log_{10} (30)$

END
